

ABSTRACT OF THE DISCLOSURE

1           A wireless communication terminal has an air interface for interfacing  
2   the terminal to a base station, an internal power source and an external power  
3   source. A power control circuit normally energizes the wireless  
4   communication terminal with the external power source and energizes the  
5   terminal with the internal power source when the external power source is  
6   faulty. A monitor circuit is provided for monitoring the external power  
7   source and sending a message from the air interface to a base station  
8   controller via the base station when the communication terminal is operating  
9   with the internal power source.
